Technical Task Management System

General Description

Technical task management system is designed for managing the technical tasks with transparent information and clear monitor under the task flows. User can access the system directly, by web link from computer or by application for mobile device.

All the input task will be classified and create ticket on system. Ticket then be assigned to technical staff automatically via mobile phone device (mobile application and sms). Technical staff doing their task under the NOC monitor and BackOffice (BO) team support, then using application to request close the ticket to complete their task.

Closing request will update the ticket status on system and be closed by NOC for network problem cases or by Call Center for customer problem cases.

Account management

The system manages the access by user name and password either by computer or mobile application. Each user has their own roll for the right of them on system.

Integration

The system has API to integrate with:

- Call center,
- Sales management system,
- Network/infrastructure management system,
- Stock management system,

Input requirements

Task management system can receive task from customer complain, sales activity, network incident, network maintenance plan or network change request from technical plan.

- Customer complain: EDM customer, during the using service, if has problem they can complain via EDM hotline 1455. The complains are classified by call center then which are technical complain will be sent to Technical task management system, as a technical ticket with detail problem information for technical process.
- Network problem report: Mozambique people if see EDM network/infrastructure problem, they can call EDM hotline 800145145 to report for that. Call center when receive calls, will ask more detail information then send a technical problem ticket to the system.
- New customer deployment: Sales force via sales system, can send the request:
  + Technical survey request for new customer deployment,
  + Technical deployment request after complete sale contract procedure,
  These request will create survey ticket or deployment ticket on system and send to technical staff that in charge of that area.

- Network incident: the system have capability to integrate with Network Management System (NMS) to receive the network incident ticket then assign for related technical staff.
- Network maintenance plan, network change plan: Technical Management force can insert to the system the tickets for network maintenance or network change.

Function modules

- Account management: create user, user pass, user working area, user roll, block user, reset user, cancel user.
- Ticket creation: create ticket from input requirements.
- Ticket assignment: assign the ticket directly to correct staff (by team, working area). Send sms to alert the staff, team manager to receive ticket. Update ticket assignment.
- Ticket monitor: monitor, update status of the tickets. Warning the staff, team manager, related technical managers of the ticket processing status.
- Customer update: to update the status of customer's problem processing status by sending ticket's status via sms to customer. So that customer can has updated detail information related their complain.
- Ticket closing: process the ticket closing. Receive the closing request from technical staff, update the ticket status. Checking the confirmation from customer (via call center) or Network management team then close or reopen the ticket.
- Staff's location monitor: to trace, get location of the technical staff (online) to support monitor the processing ticket.
- Stock management: manage the equipment and material using for each ticket when technical close the ticket.
- Reporting: report the status of the ticket and summary report status of the tickets.

Work flows:

- Customer problem: when customer has problem, they call to call center. Call center agent get detail information then create the ticket on the system. Ticket then be assigned to technical staff. Staff confirm of receiving the ticket and prepare tool, material to fix the customer problem. At same time, team manager and NOC team receive ticket assignment also, then monitor and support for staff complete the task. Staff update the ticket status by the regulation during the processing time. If has difficult, staff can ask the support from other technical force (BO force) to complete the task.

  When complete fixing problem, technical send request to close the ticket with detail information of problem, material using for task to deduct in the stock. Request will update the ticket status on the system and call center agent will call the customer to double check with customer then close the ticket or reopen the ticket base on the real result.
- Network incident/problem: when has network problem, Network management system can create the ticket on the system. Ticket then be assigned to technical staff. Staff confirm of receiving the ticket and prepare tool, material to fix the customer problem. At same time, team manager and NOC team receive ticket assignment also, then monitor and support for staff complete the task. Staff update the ticket status by the regulation during the

processing time. If has difficult, staff can ask the support from other technical force (BO force) to complete the task.

When complete fixing problem, technical send request to close the ticket with detail information of problem, material using for task to deduct in the stock. Request will update the ticket status on the system and Network management team double check the network status then close the ticket or reopen the ticket base on the real result.

- Customer deployment survey: when sales force has new customer request, they get detail customer information then create the ticket on the system. Ticket then be assigned to technical staff. Staff confirm of receiving the ticket and go to survey all the conditions for customer deployment. When complete survey, technical send result to close the ticket with detail conditions for deployment. Ticket then be update on system for sales sign contract with customer or reject customer base on the survey result.
- Customer deployment: when complete customer contract connection on sales system, sales system send request to create the deployment ticket to the system. Ticket then be assigned to technical staff. Staff confirm of receiving the ticket and prepare tool, material to deploy service for customer. At same time, team manager and NOC team receive ticket assignment also, then monitor and support for staff complete the task. Staff update the ticket status by the regulation during the processing time. If has difficult, staff can ask the support from other technical force (BO force) to complete the task.

  When complete deploying service, technical send request to close the ticket with detail information of deployment, material using for task to deduct in the stock. Request will update the ticket status on the system and call center agent will call the customer to double check with customer then close the ticket or reopen the ticket base on the real result.
- Maintenance/change plan: when has network plan, Network management team can create the ticket on the system. Ticket then be assigned to technical staff. Staff confirm of receiving the ticket and prepare tool, material to fix the customer problem. At same time, team manager and NOC team receive ticket assignment also, then monitor and support for staff complete the task. Staff update the ticket status by the regulation during the processing time. If has difficult, staff can ask the support from other technical force (BO force) to complete the task.

  When complete the task, technical send request to close the ticket with detail information of problem, material using for task to deduct in the stock. Request will update the ticket status on the system and Network management team double check the network status then close the ticket or reopen the ticket base on the real result.

Propose plan:

1. Working to make clear system requirements: 1 - 2 weeks.
2. Survey all work flows, including field survey: 3 weeks.
3. Survey support, related systems: 3 weeks.
4. Building system structure, frame plan: 04 weeks.
5. Deployment plan: agreement by both sides.
